

How Information Moves Through the System

Three journeys: when the user says something, when a question arrives, and what happens overnight · Deliverable 4 · Ketan Juikar

① When the user says something

② When a question arrives

③ Overnight, while nobody is waiting

If the memory store is down, the assistant simply answers without memory. The user still gets an answer. Memory is a bonus, never a single point of failure.

The seven rules that must never be broken

1. No user ever sees another user's memory.
2. Secrets are never saved.
3. We never use more of the budget than we were given.
4. A deleted memory is gone within 60 seconds.
5. The current preference always beats the outdated one.
6. If nothing is relevant, say so instead of guessing.
7. If memory breaks, still answer the user.

Each rule closes a failure I actually measured: rule 1 fixes leaking another user's memory 92% of the time · rule 2 fixes every secret being stored · rule 5 fixes the old preference winning one
